

Plant driven watering and feeding systems

AutoPot Systems give plants a **wet-dry cycle** via the patented AutoPot Smart-Valve (right);

The growing tray is initially filled with water (approx an inch), the plants then have to take it all up before any more water is released giving a wet-dry cycle dictated by the plants own rate of consumption!.

Add nutrients to the water to give a total “plant driven watering and feeding” solution.

**Take the guesswork out of when to water your plants **

ask your AutoPot stockist about the complete range of AutoPot modules, kits and equipment.
